Nicholas Teeple

Phase 1: Data Familiarization & Documentation

1. Read all tables

AGENTS	People who work for the company and manage entertainer bookings.
CUSTOMERS	Individuals or organizations who hire entertainers.
MEMBERS	Individual members of entertainment groups or bands.
ENTERTAINERS	Performers or entertainment groups.
ENGAGEMENTS	A booking or scheduled performance event.
MUSICAL_STYLES	Types or genres of music (e.g., jazz, rock, classical).
ENTERTAINER_STYLES	Links an entertainer to the musical styles they perform.
MUSICAL_PREFERENCES	Customer preferences for musical styles.
ENTERTAINER_MEMBERS	Relationship between entertainers and their individual members.
ZTBLDAYS	Calendar dates.
ZTBLMONTHS	Months and related date calculations.
ZTBLSKIPLABELS	Control or configuration value for label skipping.
ZTBLWEEKS	Calendar weeks.

2. Primary keys & Foreign keys

Table	Primary Key(s)	Foreign Key(s)
Agents	AgentID	—
Customers	CustomerID	—
Members	MemberID	—
Entertainers	EntertainerID	—

Engagement	EngagementNumber	CustomerID → CustomersAgentID → AgentsEntertainerID → Entertainers
Musical_Styles	StyleID	—
Entertainer_Styles	EntertainerID, StyleID	EntertainerID → EntertainersStyleID → Musical_Styles
Musical_Preferences	CustomerID, StyleID	CustomerID → CustomersStyleID → Musical_Styles
Entertainer_Members	EntertainerID, MemberID	EntertainerID → EntertainersMemberID → Members
ztblDays	DateField	—
ztblMonths	YearNumber, MonthNumber	—
ztblSkipLabels	LabelCount	—
ztblWeeks	WeekStart	—

3. Data Dictionary

Table: Agents

Agents Table		
AgentID	Unique identifier for each booking agent	
AgtFirstName	Agent's first name	varchar
AgtLastName	Agent's last name	varchar
AgtStreetAddress	Street address of the agent	varchar
AgtCity	City component of the agent's address	varchar
AgtState	State or region code	varchar
AgtZipCode	Postal/ZIP code	varchar
AgtPhoneNumber	Agent's contact phone number	varchar

DateHired	When the agent was hired	date
Salary	The agent's base salary	decimal
CommissionRate	Percentage or rate of commission	float

Table: Customers

Customers Table		
CustomerID	Unique ID for each customer (serial)	
CustFirstName	Customer's first name	varchar
CustLastName	Customer's last name	varchar
CustStreetAddress	Customer's mailing address	varchar
CustCity	Customer's city	varchar
CustState	State/region code	varchar
CustZipCode	Postal code	varchar
CustPhoneNumber	Customer's primary phone number	varchar

Table: Members

Members Table		
MemberID	Unique identifier for each band member	serial
MbrFirstName	Member's first name	varchar
MbrLastName	Member's last name	varchar
MbrPhoneNumber	Member's contact number	varchar
Gender	Member's gender code	varchar

Table: Entertainers

Entertainer Table		
EntertainerID	Unique identifier for each performer or group	serial
EntStageName	Public or stage name	varchar
EntSSN	Tax or government ID	varchar
EntStreetAddress	Mailing address	varchar
EntCity	City	varchar
EntState	State code	varchar
EntZipCode	ZIP/postal code	varchar
EntPhoneNumber	Entertainer's contact phone	varchar
EntWebPage	Website or profile page	varchar
EntEmailAddress	Entertainer's email	varchar
DateEntered	Date added to system	date

Table: Engagements

Engagement Table		
EngagementNumber	Unique ID for each entertainment booking	serial
StartDate	Start date of engagement	date
EndDate	End date of engagement	date
StartTime	Start time of engagement	time
StopTime	End time of engagement	time
ContractPrice	Total fee for the engagement	decimal
CustomerID	Linked customer	int
AgentID	Linked agent	int
EntertainerID	Linked entertainer	int

Table: Musical_Styles

Musical Styles Table		
StyleID	Unique music style ID	Serial
StyleName	Name of style or genre	varchar

Table: Entertainer_Styles

Entertainer Styles Table		
EntertainerID	Identifier for each performer or entertainment group	Int
StyleID	Music style ID	int
StyleStrength	Data type: smallint; Business meaning: Strength or rating Valid values: small integer (e.g., 1–10)	

Table: Musical_Preferences

Musical Preferences Table		
CustomerID	ID of the Customer who has this preference	int
StyleID	ID of the Style preferred by the customer	int
PreferenceSeq	Rank or sequence (1 = top preference)	smallint

Table: Entertainer_Members

Entertainer_Members Table		
EntertainerID	Identifier for each performer or entertainment group	int
MemberID	Identifier for each band member or group	int
Status	Membership status as 1 or 0	smallint

Table: ztblDays

ztblDays Table		
DateField	Calendar date	date

Table: ztblMonths

ztblMonths Table		
MonthYear	Text description of month/year; Valid values: e.g., "Jan 2023"	Varchar
YearNumber	Numeric year; Valid values: ≥ 1900	smallint
MonthNumber	Month number; Valid values: 1–12	smallint
MonthStart	First day of month	date
MonthEnd	Last day of month	date
January–December	Month indicators	smallint

Table: ztblSkipLabels

ztblSkipLabels Table		
LabelCount	Skip-label parameter; Valid values: integer ≥ 0	

Table: ztblWeeks

ztblWeeks Table		
WeekStart:	Start of week	date
WeekEnd	End of week	date

4. Explain table relationships

- Customers ↔ Engagements (1:M)
- Agents ↔ Engagements (1:M)
- Entertainers ↔ Engagements (1:M)
- Entertainers ↔ Styles (M:M via Entertainer_Styles)
- Customers ↔ Preferences (M:M via Musical_Preferences)

5. Identifying Ambiguous Fields

- Entertainers.EntSSN
 - Appears to hold Social Security Numbers or tax IDs, but:
 - Format is not standardized
 - May mix SSN + business EINs
 - Sensitive! Unclear whether this field should be masked or excluded from analysis
- Entertainer_Members.Status
 - Smallint value (0/1/2/etc.), but the meaning is not defined.
 - Possibilities: active, inactive, band leader, seasonal, contracted, etc.
 - Clarification needed:
 - Provide enumerated status codes and meanings.
- Entertainer_Styles.StyleStrength
 - Numeric strength value (e.g., 1–5?) but:
 - No defined scale
 - No business rule for how it should be interpreted
 - Might influence recommendations or matching logic
 - Clarification needed:
 - Is this 1–10, 1–5, or categorical coded as numbers?
 - Who assigns it?
- Musical_Preferences.PreferenceSeq
 - Rank order for customer preferences, but:
 - Clarification needed:
 - Rules for ranking and whether ties/duplicates are allowed.
 - Is “1” always highest?
 - Can two styles have the same rank?
 - Is the list always complete or can customers have missing ranks?
- Customer & Agent Addresses
 - All stored as plain varchar fields with no consistency rules.
 - Clarification needed:

- Business region scope and formatting requirements.
- Are they U.S. only?
- Should ZIP+4 be allowed?

Phase 2: Data Preparation, Cleaning & Evaluation

Executive Summary

We evaluated data quality across each table in the TuneWorks database. Overall, the dataset is reliable with minimal missing values. Key findings include:

- **No missing values** in core business tables (Engagements, Customers, Agents)
- **Minor gaps** in the Entertainers table (5 missing websites, 6 missing emails)
- **One data quality issue:** Agent "Daffy Dumbwit" has an unrealistic salary (\$50)
- **Data limitation:** Only 6 months of engagement data (Sept 2017 - March 2018)

2.1 Data Quality Assessment by Table

2.1.1 Engagements Table

Missing Values

- Missing StartDate/EndDate prevents calculation of event duration.
- Missing ContractPrice affects all revenue analysis.
- Missing AgentID/CustomerID/EntertainerID indicates broken foreign key relationships.
- Missing StartTime/StopTime weakens scheduling analysis.

Missing Values	SQL query	<pre>select sum(case when startdate is null then 1 else 0 end) as missing_startdate, sum(case when enddate is null then 1 else 0 end) as missing_enddate, sum(case when starttime is null then 1 else 0 end) as missing_starttime, sum(case when stoptime is null then 1 else 0 end) as missing_stoptime, sum(case when contractprice is null then 1 else 0 end) as missing_contractprice,</pre>
----------------	-----------	--

	<pre>sum(case when agentid is null then 1 else 0 end) as missing_agentid, sum(case when customerid is null then 1 else 0 end) as missing_customerid, sum(case when entertainerid is null then 1 else 0 end) as missing_entertainerid from engagements;</pre>														
Result	<table><tr><td>123 missing_startdate</td><td>123 missing_enddate</td><td>123 missing_starttime</td><td>123 missing_stoptime</td><td>123 missing_contractprice</td><td>123 missing_agentid</td><td>123 missing_customerid</td></tr><tr><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr></table>	123 missing_startdate	123 missing_enddate	123 missing_starttime	123 missing_stoptime	123 missing_contractprice	123 missing_agentid	123 missing_customerid	1	0	0	0	0	0	0
123 missing_startdate	123 missing_enddate	123 missing_starttime	123 missing_stoptime	123 missing_contractprice	123 missing_agentid	123 missing_customerid									
1	0	0	0	0	0	0									
Finding	No missing values in any field														

Invalid Dates

Invalid Dates	SQL query	<code>select count(*)</code> <code>from engagements</code> <code>where enddate < startdate;</code>
	Result	
	Finding	Rationale: Engagements with EndDate earlier than StartDate reflect data entry errors and must be corrected or excluded. Insight: All dates valid ($\text{EndDate} \geq \text{StartDate}$)

Duplicate Bookings

Duplicate Bookings	SQL query	<pre>select customerid, entertainerid, startdate, count(*) as dup_count from engagements group by customerid, entertainerid, startdate having count(*) > 1;</pre>														
	Result	<table><thead><tr><th></th><th>123 customerid</th><th>123 entertainerid</th><th>startdate</th><th>123 dup_count</th></tr></thead><tbody><tr><td></td><td></td><td></td><td></td><td></td></tr><tr><td></td><td></td><td></td><td></td><td></td></tr></tbody></table>		123 customerid	123 entertainerid	startdate	123 dup_count									
	123 customerid	123 entertainerid	startdate	123 dup_count												

	Finding	Rationale: Duplicate checks are necessary to ensure the Engagements table does not contain repeated bookings that would inflate revenue and distort analysis. Insight: No duplicate bookings
--	----------------	---

Contract Price Outliers (High)

Contract Price Outliers (High)	SQL query	select * from engagements order by contractprice desc limit 10;
	Result	
	Finding	Rationale: Extremely high values may be special events or data errors. Insight: Reasonable range, no extreme outliers

Contract Price Outliers (Low)

Contract Price Outliers (Low)	SQL query	select * from engagements order by contractprice asc limit 10;
	Result	
	Finding	Rationale: All positive values, no zeros or negatives Insight: Zero or negative values are invalid and should be reviewed.

Duration Outliers (Long)

Duration Outliers (Long)	SQL query	select engagementnumber, startdate,
---------------------------------	------------------	--

		enddate, (enddate - startdate) as durationdays from engagements order by durationdays desc limit 10;																																																							
	Result	<table><tr><th></th><th>123 engagementnumber</th><th>startdate</th><th>enddate</th><th>123 durationdays</th></tr><tr><td>1</td><td>99</td><td>2018-01-23</td><td>2018-02-23</td><td>31</td></tr><tr><td>2</td><td>9</td><td>2017-09-19</td><td>2017-09-29</td><td>10</td></tr><tr><td>3</td><td>88</td><td>2018-01-08</td><td>2018-01-18</td><td>10</td></tr><tr><td>4</td><td>75</td><td>2018-01-02</td><td>2018-01-12</td><td>10</td></tr><tr><td>5</td><td>36</td><td>2017-10-14</td><td>2017-10-24</td><td>10</td></tr><tr><td>6</td><td>72</td><td>2017-12-23</td><td>2018-01-02</td><td>10</td></tr><tr><td>7</td><td>73</td><td>2017-12-30</td><td>2018-01-08</td><td>9</td></tr><tr><td>8</td><td>31</td><td>2017-10-08</td><td>2017-10-17</td><td>9</td></tr><tr><td>9</td><td>32</td><td>2017-10-08</td><td>2017-10-17</td><td>9</td></tr><tr><td>10</td><td>10</td><td>2017-09-18</td><td>2017-09-27</td><td>9</td></tr></table>		123 engagementnumber	startdate	enddate	123 durationdays	1	99	2018-01-23	2018-02-23	31	2	9	2017-09-19	2017-09-29	10	3	88	2018-01-08	2018-01-18	10	4	75	2018-01-02	2018-01-12	10	5	36	2017-10-14	2017-10-24	10	6	72	2017-12-23	2018-01-02	10	7	73	2017-12-30	2018-01-08	9	8	31	2017-10-08	2017-10-17	9	9	32	2017-10-08	2017-10-17	9	10	10	2017-09-18	2017-09-27	9
		123 engagementnumber	startdate	enddate	123 durationdays																																																				
1	99	2018-01-23	2018-02-23	31																																																					
2	9	2017-09-19	2017-09-29	10																																																					
3	88	2018-01-08	2018-01-18	10																																																					
4	75	2018-01-02	2018-01-12	10																																																					
5	36	2017-10-14	2017-10-24	10																																																					
6	72	2017-12-23	2018-01-02	10																																																					
7	73	2017-12-30	2018-01-08	9																																																					
8	31	2017-10-08	2017-10-17	9																																																					
9	32	2017-10-08	2017-10-17	9																																																					
10	10	2017-09-18	2017-09-27	9																																																					
Finding	Rationale: Very long durations may reflect multi-day contracts or incorrect end dates. Insight: Range appears legitimate (single-day → month-long bookings)																																																								

Duration Outliers (Short)

Duration Outliers (Short)	SQL query	<pre>select engagementnumber, startdate, enddate, (enddate - startdate) as durationdays from engagements order by durationdays asc limit 10;</pre>																																																						
	Result	<table><tr><th></th><th>123 engagementnumber</th><th>startdate</th><th>enddate</th><th>123 durationdays</th></tr><tr><td>1</td><td>90</td><td>2018-01-09</td><td>2018-01-09</td><td>0</td></tr><tr><td>2</td><td>43</td><td>2017-10-22</td><td>2017-10-22</td><td>0</td></tr><tr><td>3</td><td>118</td><td>2018-02-19</td><td>2018-02-19</td><td>0</td></tr><tr><td>4</td><td>97</td><td>2018-01-20</td><td>2018-01-20</td><td>0</td></tr><tr><td>5</td><td>23</td><td>2017-10-01</td><td>2017-10-01</td><td>0</td></tr><tr><td>6</td><td>53</td><td>2017-11-12</td><td>2017-11-13</td><td>1</td></tr><tr><td>7</td><td>52</td><td>2017-11-14</td><td>2017-11-15</td><td>1</td></tr><tr><td>8</td><td>48</td><td>2017-11-06</td><td>2017-11-07</td><td>1</td></tr><tr><td>9</td><td>11</td><td>2017-09-16</td><td>2017-09-17</td><td>1</td></tr><tr><td>10</td><td>35</td><td>2017-10-15</td><td>2017-10-16</td><td>1</td></tr></table>		123 engagementnumber	startdate	enddate	123 durationdays	1	90	2018-01-09	2018-01-09	0	2	43	2017-10-22	2017-10-22	0	3	118	2018-02-19	2018-02-19	0	4	97	2018-01-20	2018-01-20	0	5	23	2017-10-01	2017-10-01	0	6	53	2017-11-12	2017-11-13	1	7	52	2017-11-14	2017-11-15	1	8	48	2017-11-06	2017-11-07	1	9	11	2017-09-16	2017-09-17	1	10	35	2017-10-15	2017-10-16
	123 engagementnumber	startdate	enddate	123 durationdays																																																				
1	90	2018-01-09	2018-01-09	0																																																				
2	43	2017-10-22	2017-10-22	0																																																				
3	118	2018-02-19	2018-02-19	0																																																				
4	97	2018-01-20	2018-01-20	0																																																				
5	23	2017-10-01	2017-10-01	0																																																				
6	53	2017-11-12	2017-11-13	1																																																				
7	52	2017-11-14	2017-11-15	1																																																				
8	48	2017-11-06	2017-11-07	1																																																				
9	11	2017-09-16	2017-09-17	1																																																				
10	35	2017-10-15	2017-10-16	1																																																				

	Finding	Rationale: Very short or zero-day durations may indicate scheduling errors. Insight: Expected pattern for single-day events
--	----------------	--

Foreign Key: Missing Customer

Foreign Key: Missing Customer	SQL query	<pre>select e.* from engagements e left join customers c on e.customerid = c.customerid where c.customerid is null;</pre>
	Result	
	Finding	Rationale: Engagement rows referring to non-existent agents/customers/entertainers should not be used in analysis until corrected. Insight: All engagements link to valid customers

Foreign Key: Missing Agent

Foreign Key: Missing Agent	SQL query	<pre>select e.* from engagements e left join agents a on e.agentid = a.agentid where a.agentid is null;</pre>
	Result	
	Finding	Rationale: Engagement rows referring to non-existent agents/customers/entertainers should not be used in analysis until corrected. Insight: All engagements link to valid agents

Foreign Key: Missing Entertainer

Foreign Key: Missing Entertainer	SQL query	<pre>select e.* from engagements e left join entertainers en on e.entertainerid = en.entertainerid where en.entertainerid is null;</pre>
--	-----------	--

	Result	
	Finding	Rationale: Engagement rows referring to non-existent agents/customers/entertainers should not be used in analysis until corrected. Insight: All engagements link to valid entertainers

Table summary

The Engagements table shows strong data quality, with no missing values, no invalid date sequences, and no duplicate customer–entertainer–date combinations. Contract price and duration checks reveal only a few mild outliers that likely reflect legitimate special events rather than errors. All foreign-key references successfully map to valid agents, customers, and entertainers, indicating the table is internally consistent and reliable for analysis. The concern with the Engagements data is that there is only data from 09/2017-03/2018, giving us only a half-year worth of data. This contrasts the hire dates of agents, which happened in the late 90s & early 2000s.

2.1.2 Customers Table

Missing Values

- Missing addresses or ZIP codes will weaken geographic segmentation.
- Missing phone numbers will hinder customer communication.
- Missing names will prevent proper identification.

Missing Values	SQL query	<pre>select sum(case when custfirstname is null then 1 else 0 end) as missing_firstname, sum(case when custlastname is null then 1 else 0 end) as missing_lastname, sum(case when custstreetaddress is null then 1 else 0 end) as missing_address, sum(case when custzipcode is null then 1 else 0 end) as missing_zip, sum(case when custphonenumber is null then 1 else 0 end) as missing_phone from customers;</pre>
-----------------------	------------------	---

	Result	
	Finding	Insight: 100% complete data

Invalid ZIP Codes

Invalid ZIP Codes	SQL query	<pre>select * from customers where length(custzipcode) <> 5 or custzipcode < '00000' or custzipcode > '99999';</pre>
	Result	
	Finding	Rationale: ZIP must be 5-digit numeric; incorrect formats disrupt regional analysis. Insight: All ZIP codes properly formatted (5 digits)

Duplicate Customers

Duplicate Customers	SQL query	<pre>select custfirstname, custlastname, custphonenumber, count(*) as dup_count from customers group by custfirstname, custlastname, custphonenumber having count(*) > 1;</pre>
	Result	
	Finding	Rationale: Duplicate customer entries can inflate customer counts and engagement frequency. Insight: No duplicate customer records

Table Summary:

Customer records are highly complete, with no missing names, addresses, ZIP codes, or phone numbers. ZIP-code validation shows that all entries follow a proper 5-digit numeric format, and duplicate customer

profiles are extremely rare. Overall, the table exhibits strong consistency and minimal data-quality concerns.

2.1.3 Agents Table

Missing Values

- Missing salary values make it difficult to evaluate agent compensation.
- Missing phone numbers hinder communication.

Missing Values	SQL query	<pre>select sum(case when agtphonenumber is null then 1 else 0 end) as <i>missing_phone</i>, sum(case when salary is null then 1 else 0 end) as <i>missing_salary</i> from agents;</pre>						
	Result	<table><tr><th></th><th>123 missing_phone</th><th>123 missing_salary</th></tr><tr><td>1</td><td>0</td><td>0</td></tr></table>		123 missing_phone	123 missing_salary	1	0	0
		123 missing_phone	123 missing_salary					
1	0	0						
Finding	Insight: No missing phone numbers or salaries							

Invalid ZIP Codes

Invalid ZIP Codes	SQL query	<pre>select * from agents where length(agtzipcode) <> 5 or agtzipcode < '00000' or agtzipcode > '99999';</pre>
	Result	
	Finding	Rationale: Incorrect ZIP formatting affects understanding of agent regions. Insight: All ZIP codes properly formatted

Salary Outliers

Salary Outliers	SQL query	<pre>select * from agents order by salary;</pre>
	Result	
	Finding	Rationale: Extremely low or high salaries may indicate temporary agents or data entry issues. Insight: Daffy Dumbwit salary = \$50 (unrealistic, likely data-entry error)

Duplicate Agent Names

Duplicate Agent Names	SQL query	<pre>select agtfirstname, agtlastname, count(*) as dup_count from agents group by agtfirstname, agtlastname having count(*) > 1;</pre>
	Result	
	Finding	Rationale: Duplicate names may be normal, but duplication with identical phone/address should be reviewed. Insight: No duplicate agent names

Table Summary:

The Agents table is largely complete, with no missing salaries or phone numbers and generally valid ZIP-code formats. However, the salary distribution reveals one clear outlier with a value of 50, which is unrealistically low compared to other agents and strongly suggests a data-entry error rather than a legitimate compensation level. Aside from this anomaly, duplicate agent names are rare and do not appear to indicate duplicate records, making the table mostly consistent but requiring correction of the salary outlier for accurate analysis. So I would verify the intended value and correct it if possible, otherwise I would exclude this row from salary-based analysis to prevent distortion.

2.1.4 Entertainers Table

Missing Values

- Missing stage names prevent identifying performers.
- Missing phone/email/website reduces ability to contact performers.

Missing Values	SQL query	<pre>select sum(case when entstagename is null then 1 else 0 end) as missing_name, sum(case when entphonenum is null then 1 else 0 end) as missing_phone, sum(case when entwebpage is null then 1 else 0 end) as missing_website, sum(case when entemailaddress is null then 1 else 0 end) as missing_email from entertainers;</pre>
	Result	
	Finding	Insight: Core fields complete (name + phone), but 5 missing websites and 6 missing emails

Duplicate Stage Names

Duplicate Stage Names	SQL query	<pre>select entstagename, count(*) as dup_count from entertainers group by entstagename having count(*) > 1;</pre>
	Result	
	Finding	Rationale: Duplicate stage names may indicate data entry mistakes or unintended duplicate entertainer records. Insight: No duplicate entertainer records

DateEntered Outliers

DateEntered Outliers	SQL query	select * from entertainers order by dateentered;
	Result	
	Finding	Rationale: Very early or unusually recent DateEntered values may reflect incorrect data entry or inconsistent onboarding records. Insight: Consistent date range, no obvious errors

Table Summary:

The Entertainers table is complete for core identifiers like stage name and phone number, but it contains several missing optional fields: 5 missing websites and 6 missing email addresses. These gaps are not severe because websites and email are supplementary contact fields, yet they reduce the ability to fully profile entertainers or contact them digitally. These can be addressed by either retrieving the correct contact information from the original source system or imputing a placeholder such as “Not Provided” to standardize the dataset while acknowledging incomplete records.

2.1.5 Musical_Preferences Table

Foreign Key: Missing Customer

Foreign Key: Missing Customer	SQL query	select mp.* from musical_preferences mp left join customers c on mp.customerid = c.customerid where c.customerid is null;
	Result	
	Finding	Rationale: Broken preference mappings may occur if customers or styles were removed. Insight: All preferences link to valid customers

Foreign Key: Missing Style

Foreign Key: Missing Style	SQL query	<pre>select mp.* from musical_preferences mp left join musical_styles s on mp.styleid = s.styleid where s.styleid is null;</pre>
	Result	
	Finding	Rationale: Broken preference mappings may occur if customers or styles were removed. Insight: All preferences link to valid styles

Table Summary:

Foreign-key checks confirm that every preference correctly links to an existing customer and a valid musical style, indicating no broken mappings. The table appears clean and structurally reliable for preference-based analysis.

2.1.6 Entertainer_Styles Table

Foreign Key: Missing Entertainer

Foreign Key: Missing Entertainer	SQL query	<pre>select es.* from entertainer_styles es left join entertainers e on es.entertainerid = e.entertainerid where e.entertainerid is null;</pre>
	Result	
	Finding	Rationale: Missing style mappings reduce accuracy of style-based performance insights. Insight: All style mappings link to valid entertainers

Foreign Key: Missing Style

Foreign Key: Missing Style	SQL query	<pre>select es.* from entertainer_styles es left join musical_styles s on es.styleid = s.styleid where s.styleid is null;</pre>
	Result	
	Finding	Rationale: Missing style mappings reduce accuracy of style-based performance insights. Insight: All style mappings link to valid styles

Table Summary:

The Entertainer_Styles table shows no missing entertainer or style references, meaning all style-strength mappings are valid. The table exhibits strong relationship integrity and no observable data-quality issues.

2.2 Data Completeness & Recommendations

The dataset is structurally sound and highly usable, with complete core fields, consistent formatting, and strong foreign-key integrity across all tables. Only small issues require minor correction before further analysis.

The dataset contains inconsistencies, such as Daffy’s salary being listed as “50” and agent hire dates that are implausibly old given that only six months of engagement data are available. Data quality should be improved by correcting inaccurate entries and standardizing inconsistent fields. Revenue information is limited to ContractPrice, with no secondary revenue streams recorded, and the only expense fields tracked are Salary and CommissionRate. Revenue tracking should be expanded to capture additional income sources such as concessions or merchandise sales, while expense tracking should include operational costs to enable full profit-and-loss evaluations.

There is no data on customer demographics, and key agent performance metrics, such as lead generation and retention, are missing. To improve the value and depth of future analytics, the dataset would benefit from additional information such as customer demographics (age, income level, booking history, event preferences), agent performance metrics (number of successful engagements, response times, satisfaction ratings), and richer entertainer details (experience level, previous event reviews, availability). Collecting customer demographic information will support targeted marketing. Additional performance metrics such as leads generated, conversion rates, and customer retention by agent should also be implemented to

strengthen future analyses. Including these fields would enable more accurate segmentation, better forecasting models, stronger matching algorithms, and more actionable business insights.

Phase 3: Exploratory Analysis & Insight Generation

Phase 3A — Agent Analysis

Exploratory Process

We began by examining total revenue per agent to see whether performance was evenly distributed or dominated by a small group. The results showed a clearly top-heavy pattern, so we next looked at engagement volume per agent to test whether the gap was mainly driven by booking frequency. To separate pricing effects from volume, we then calculated average contract price per agent, which helped us identify agents who consistently negotiate higher-value deals versus those who rely on lower-priced bookings. We also analyzed engagement duration patterns to check whether longer bookings are linked to higher value or to specific agents. Finally, we segmented high-value customers (top 25% by revenue) and mapped them back to their agents, then compared each agent’s total revenue against the overall average to flag underperformers. Together, these steps move from simple volume and revenue checks to a richer view of pricing power, deal structure, and customer mix, allowing us to distinguish true top performers from structurally weak agents.

Data quality notes

- No contract price outliers or missing dates appeared, suggesting consistent recording.
- All agents appear in the mapping table with valid IDs, and no join mismatches were detected.
- Engagement duration is consistently non-negative, confirming correct date ordering.

		her revenue despite high volume. The pricing analysis confirmed John's strength but revealed a more concerning pattern with Maria. She secured 15 engagements but averaged only \$855 per contract, the lowest among active agents. This was surprising because high engagement volume typically correlates with strong revenue performance. We began to suspect either a negotiation issue or a systematic difference in her client base, which prompted us to investigate which agents were serving high-value customers.

- earnings_salary_proportion was calculated by dividing sum_contracts by base_salary. A value of 1 would indicate that an agent's base salary equals the total value of contracts they are attached to.
- There is just under a half year's worth of engagement data available, meaning that values for this ratio below 0.5 mark lesser performance (without even considering commission payouts).
- Daffy, Scott, Maria, and Caleb are all behind pace in terms of matching their base salaries with contract revenue. Against his salary, Scott is severely underperforming.
- Scott's performance metrics raised immediate concerns. His 0.21 earnings-to-salary ratio indicated he generated only \$6,720 in contracts against a \$32K base salary over six months. He wasn't covering his own cost, let alone contributing to broader organizational overhead. While we expected Daffy's zero output, Scott's underperformance relative to his above-average compensation represented the most significant resource misallocation in the agent portfolio.

Phase 3B — Entertainer & Styles Analysis

Exploratory Process

We began by ranking entertainers by total revenue to determine whether performance was broadly distributed or dominated by a few key acts. The revenue distribution revealed a sharp concentration at the top, which prompted us to explore engagement frequency and style-level revenue to understand whether entertainer performance was driven by popularity, genre demand, or pricing. We then compared entertainers' bookings with their associated musical styles to assess how style availability influenced performance. Finally, we evaluated entertainer performance relative to the style catalog to identify unused or low-demand styles and determine whether capacity constraints existed among top performers. These steps allowed us to connect entertainer success with underlying customer preferences and the structure of the style inventory.

Data quality notes

- Several musical styles appear in the reference table but never occur in actual engagements, creating a long tail of zero-activity styles.
- A few entertainers show zero engagements, which results in NULL revenue values but accurately reflects inactive performers.
- No missing or inconsistent style mappings were found; entertainer-to-style joins consistently resolved.
- All entertainers with revenue also had valid style associations, confirming no orphan records or broken relationships.

EDA Results for entertainer& styles

- Susan McLain (\$2,670)
- Katherine Ehrlich (\$0)

Revenue contribution is heavily skewed toward a few top entertainers.

- Country Feeling's \$34K in revenue was nearly double the second-place performer. The top 5 entertainers accounted for \$96K (62% of total revenue), while the bottom 5 combined generated

		just \$19K. This concentration mirrored the pattern we observed in agent performance. We needed to determine whether this disparity stemmed from booking frequency differences or from pricing power, which led us to analyze engagement counts.

		• Variety (\$21,220) • Jazz (\$20,550) • Salsa (\$20,080) • Classic Rock & Roll (\$17,150) • Show Tunes (\$15,425) • Country Rock (\$14,875) Low revenue styles • Chamber Music (\$4,345) • Folk (\$5,700) • Motown (\$6,620) Zero revenue styles • Rap, Modern Rock, 50's/70's/80's/90's Music, Elvis, Karaoke, Ballroom, etc. Only a subset of styles drives nearly all revenue; many styles have no commercial traction. • The genre analysis revealed that 60's Music and Country together generate \$100K, representing 43% of all revenue. Meanwhile, TuneWorks maintains a catalog of 26 styles, with many generating zero revenue. This raised an obvious question: why allocate resources to genres like Rap, Modern Rock, and Ballroom if they produce no bookings? This finding became central to our recommendation about reallocating resources from unproductive genres. However, we wanted to examine customer preference data first to distinguish between lack of demand and lack of supply.
4	Which styles are most popular? At or Above Average Performers

- Country Feeling
- JV & the Deep Six
- Caroline Coie Cuartet
- Coldwater Cattle Company
- Modern Dance
- Saturday Revue
- Carol Peacock Trio

These entertainers exceed average revenue or engagement expectations.

Underperformers

- Topazz
- Jazz Persuasion
- Julia Schnebly
- Jim Glynn
- Susan McLain
- Katherine Ehrlich (0 engagements / 0 revenue)

The bottom group contributes little financially and may require repositioning,

Phase 3C — Customers & Demand Trends

Exploratory Process:

We began the customer analysis by evaluating revenue by city and ZIP code to understand the geographic distribution of demand. The strong concentration of revenue in a few high-value locations led us to examine repeat customer behavior to determine whether demand was driven by a broad customer base or a smaller group of loyal clients. After observing strong retention patterns, we explored monthly engagement trends using the ztblMonths table to identify seasonality or peak periods that might influence scheduling or performer availability. We then compared customer musical preferences with their actual bookings to assess whether stated preferences aligned with market behavior. These steps helped us identify demand concentration, behavioral drivers, and structural trends in the customer base.

Data quality notes

- Some ZIP codes appear only once, while others appear extensively; this reflects true geographic distribution rather than missing data.
- No missing customer names, IDs, or engagement mappings were detected, confirming stable relational integrity.
- Several months in ztblMonths show zero engagements, which aligns with off-season behavior rather than data gaps.
- Certain preferred styles never appear in bookings, indicating no inconsistencies but highlighting catalog oversupply.

EDA Results for Customer& Demand Trends

Customers & Demand Trends																																												
1	Revenue by city/ZIP	-- 1. Revenue by City/ZIP <pre> SELECT c.CustCity, c.CustState, c.CustZipCode, SUM(e.ContractPrice) AS TotalRevenue, COUNT(e.EngagementNumber) AS EngagementCount FROM Customers c JOIN Engagements e ON c.CustomerID = e.CustomerID GROUP BY c.CustCity, c.CustState, c.CustZipCode ORDER BY TotalRevenue DESC; </pre>

Auburn	WA	98002	25,585	8																																								
Tacoma	WA	98413	25,490	19																																								
Kirkland	WA	98033	19,705	20																																								
Redmond	WA	98052	18,615	18																																								
Seattle	WA	98105	10,795	8																																								
Seattle	WA	98115	8,255	7																																								
		• Bellevue is the primary revenue hub, generating \$32,105 and 31																																										

		engagements - far ahead of any other city. • Auburn and Tacoma follow with \$25K revenue range and 8–19 engagements, showing consistent mid-level demand. • Seattle demand is fragmented: ◦ ZIP 98105 generates \$10,795 with 8 engagements, ◦ ZIP 98115 only \$8,255 from 7 engagements. → Different Seattle ZIPs have different customer value levels. • Kirkland & Redmond fall in the \$18–20K tier, stable but not high-value. Bellevue is the core market → prioritize top entertainers, marketing, and agent focus there. Seattle ZIP-level segmentation is required — customer value varies significantly within the city • Auburn emerged as the most significant geographic finding. With only 8 engagements generating \$25.6K, Auburn achieved a \$3,200 per-booking average, double the overall rate. While we lacked demographic data to explain this efficiency, the magnitude of the difference was too substantial to ignore. Bellevue's absolute revenue (\$32K) was higher, but Auburn's efficiency metrics made it the more compelling growth opportunity.
2	Repeat Customer Analysis Repeat customer = customers with more than one engagement We also want count of engagements, total revenue, first–last engagement span	-- 2. - January is extremely high-volume, especially:
 - Jan 2018: 28 engagements, \$43,880 revenue.
- February also strong (20 engagements, \$21,685 in 2018).
- October is another peak month
 - Oct 2018: 22 engagements, \$30,125 revenue.
- Summer months (June to August) consistently show near-zero activity.
- Late-year activity (Nov–Dec) is inconsistent, mostly low except:
 - Dec 2017: 17 engagements, ~\$17K.

		Seasonality Interpretation • Q1 (Jan–Feb) = Strongest booking season. • Q4 (Oct) = strong secondary season. • Summer = low demand, customers do not book events mid-year. Business impact • Staffing and entertainer availability should be optimized for Jan–Feb + October. • The seasonality analysis was limited by data availability. January 2018 showed high activity (28 engagements, \$43K), and summer months appeared consistently weak, but with only six months of data we couldn't distinguish normal seasonal patterns from anomalous events. This represented a clear analytical limitation. TuneWorks would need at least 12 months of historical data before implementing staffing or pricing strategies based on seasonal trends.

- Customers *do* frequently book their top-preferred style:
 - Customer *10,010*: Prefers Rhythm and Blues (Seq 1) → books 13 times.
 - Customer *10,001*: Prefers Top 40 Hits → books 8 times.
 - Customer *10,014*: Prefers Top 40 Hits → books 10 times.
- Lower preference ranks (seq 2–3) still show booking activity, but at a much lower frequency.
- Some styles are preferred but rarely booked, indicating:
 - Availability mismatch, or
 - Customer interest but not enough entertainer supply.
- TuneWorks should match entertainer inventory to customer preferences.

		- Top 40 Hits, R&B, Jazz, Contemporary show actual booking alignment → reliable demand drivers. - Styles with preference but zero bookings represent latent demand or inventory gaps.

		• Quartile 3: decreasing engagement, sometimes low frequency. • Quartile 4: typically \$4–7K revenue contributors, lowest engagement count. • Q1 customers are the financial backbone → must be prioritized. • Q2 customers show potential → can be converted into Q1 with targeted retention offers. • Q4 customers may not justify heavy personalization — cost-conscious or infrequent bookers.
--	--	--

Phase 4: Synthesis & Recommendations

Introduction

The overall objective of this synthesis and recommendation section is to identify insights and their corresponding recommendations for the major operational pillars of TuneWorks. In general, KPIs across different categories varied highly. The challenge: performance is highly concentrated in a few key agents, entertainers, and markets, creating a capacity ceiling that limits long-term growth. Our proposed actions seek to build upon TuneWorks’ current strengths while strategically developing additional sources of revenue in underutilized areas. By following these recommendations, TuneWorks will be able to improve operations and revenue, identify opportunities, and especially plan for long-term sustainable growth.

Agent Analysis

Insights

Analysis of the six months of engagement data shows that Carol, John, and Marianne are the top-performing agents based on total contract value. In contrast, Scott is the most notable underperformer relative to his compensation: despite low performance, he has the fifth-highest base salary and commission rate. Additional performance issues include Daffy, who has no output; Scott and Caleb, who both generate low engagement volume; and Maria, who secures many contracts but does so at a significantly lower average price (\$855 compared to over \$1,000 for almost all other agents). High-value clients are currently served by the strongest agents. While this alignment should continue, developing additional agent capacity will enable TuneWorks to handle increased volume and reduce dependence on a few top performers.

Recommendations

Compensation structures should be realigned so that commission rates, and potentially base salaries, correspond more directly with demonstrated performance. Agents exceeding \$25K in quarterly bookings receive 15% commission on incremental revenue, driving competitive performance. These adjustments should be made once a full 12 months of data is available to ensure accuracy. Targeted training should also be implemented: Daffy would benefit from onboarding support, Scott and Caleb need guidance in lead generation and sales pipeline development, and Maria should receive coaching to strengthen her negotiation and pricing strategies. Because Carol, John, and Marianne consistently generate strong results, they should continue receiving priority access to the highest-value leads.

Entertainer & Style Analysis

Insights

Country Feeling stands out as the strongest entertainer, achieving both the highest number of engagements (15) and the highest average revenue per engagement. Several other acts, including Susan McLain, Jim Glynn, Julia Schnebly, and Jazz Persuasion, produce minimal revenue. From a stylistic standpoint, 60's Music and Country are the dominant and most commercially successful genres, while many other genres, such as Rap, Modern Rock, Ballroom, Elvis, and various decade-based genres, generate no revenue at all.

Recommendations

The agency should continue prioritizing Country Feeling (\$34K), JV & the Deep Six (\$17K), and Caroline Coie Cuartet (\$15K), the top revenue-generating entertainers. To reduce dependence on individual performers and build additional capacity, TuneWorks should pursue two parallel strategies: (1) actively recruit 2-3 new acts within proven high-demand genres (60's Music and Country, which generate 43% of total revenue), and (2) invest marketing resources in developing mid-tier performers like Coldwater Cattle Company, Modern Dance, and Saturday Revue, who show solid performance but could benefit from increased promotion. Low-performing acts generating minimal revenue should be evaluated for repositioning or removal, with resources redirected to support these growth initiatives.

Customer & Demand Trends

Insights

Bellevue emerges as the strongest market in both revenue and engagement count. Auburn also shows exceptional promise, generating \$25.6k from just eight engagements, indicating a highly efficient revenue-to-engagement ratio. Tacoma is the third-strongest city and remains an important market. Customer behavior shows strong loyalty, with many clients booking repeatedly and typically favoring the same genres across engagements. Due to limited data, it is difficult to draw conclusions about seasonality.

Recommendations

Efforts should be focused on maintaining and expanding the Bellevue market while investing further in Auburn, where increased engagement volume could yield substantial returns. Tacoma should also be prioritized for growth marketing. Advertising should be tailored to the specific genres preferred by different demographic groups, with older audiences, for example, more likely to respond to promotions for 60's Music. Genre-relevant conventions and events should be considered for targeted outreach. Additional months of data collection are needed before implementing seasonality-based staffing or forecasting decisions.

Summary

Overall, TuneWorks should continue investing in top performers while developing additional revenue sources in underutilized areas. The most important recommendations for TuneWorks are to realign agent compensation and training to better match actual performance, prioritize top-performing entertainers and high-demand genres, and focus marketing resources on the strongest geographic markets. Compensation and commission structures should be revised once a full year of data is available, while underperforming agents receive targeted skill development. The agency should deepen its relationship with Country Feeling and expand offerings within 60's Music and Country. Marketing efforts should center on Bellevue, Auburn, and Tacoma, with targeted outreach based on genre and demographic fit. Finally, improved data collection, especially around revenue streams, operational expenses, customer demographics, and agent KPIs, will enable more accurate performance evaluation and more strategic decision-making going forward. By balancing investment in current strengths with development of new capacity, TuneWorks can build a more resilient, scalable business positioned for sustainable long-term growth.
